DETAILED ACTION

Response to Arguments

- 1. Applicant's arguments, see page 13; lines 1-7, filed 12/22/03, with respect to the rejection(s) of claim(s) 1-4 and 7-9 under 35 U.S.C. 103(a) have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, a new ground(s) of rejection is made in view of Galipeau et al. (US 6,249,913) in further view of Kumar et al. (US 5,561,769).
- 2. Applicant's arguments with respect to claims 5 and 6 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

3. Claims 1-5 and 7-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Galipeau et al. (US 6,249,913 B1) in further view of Kumar et al. (US 5,561,769).

As to claim 1, note the Galipeau et al. reference that discloses an aircraft data management system. The claimed "plurality of display device, each device including at least a control processor, a local memory storage area and a display" are met by aircraft multimedia communication system having nodes comprising display, memory and processor (see Fig 12 (226); 11:55). The claimed network including a serial wiring harness, the harness interconnecting each of the plurality of display devices is met by seat-to-seat serial cables and harnesses (see Fig. 1 (20), Fig. 9b (20) and col. 4 ln. 31-34) wherein "...on-aircraft data server stores and compresses digital audio and video streams, retrieves the video and audio data, merges it into a continuous stream...delivers it seamlessly to the in-flight distribution network. Operating much like a conventional local area network (LAN)" (see col. 1 ln. 58-65). However, the Galipeau et

Art Unit: 2614

al. reference is silent wherein each of the plurality of display devices cooperating over a local area network defining a distributed server local area network architecture. Now note the Kumar et al. reference that discloses a method and apparatus for executing a distributed algorithm or service on a simple network management protocol based computer network. The Kumar et al. reference discloses a distributed local area network (see col. 3, ln. 4-14) wherein each node is both a manager and an agent (client and server). Therefore, the examiner submits that it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the Galipeau et al. centralized manager configuration with the Kumar et al. distributed client/server nodes for the purpose of reducing communication overhead that occurs around a management station and alleviating the centralized management's inherent single point of failure (see col. 1, ln. 41-59).

As to claim 2, the modification of claim 1 above yields network nodes of the distributed network at the display devices (see Fig.3 and col.8 ln.49-61), as claimed.

As to claim 3, as noted above, the nodes of the distributed network act as servers in the distributed server network architecture. Galipeau et al. particularly discloses the serving of multiple applications and data from multiple sources (see Fig. 12 (192),(198), and col.2 ln.59).

As to claim 4, as noted above, the nodes of the network serve multiple applications and data, which includes email, Web content, video, and telephony, as claimed.

As to claim 5, note the Galipeau et al. reference that discloses an aircraft data management system. The claimed "plurality of display devices, each display device disposed in a location separate from other ones of the plurality of display devices, each display device including at least a control processor, a local memory storage and a graphical display screen" are

Art Unit: 2614

met by locationally separate nodes (see Fig. 1) comprising display, memory and processor (see Fig. 12 (226) and col. 11 ln. 55) as well as seat-to-seat serial cables and harnesses (see Fig. 1 (20), Fig. 9b *20) and col. 4 ln. 31-34).

The claimed "network signal bus interconnecting each of the plurality of display devices" is met by seat-to-seat serial cables and harnesses (see Fig. 1 (20), Fig. 9b (20) and col. 4 ln. 31-34) wherein "...on-aircraft data server stores and compresses digital audio and video streams, retrieves the video and audio data, merges it into a continuous stream...delivers it seamlessly to the in-flight distribution network. Operating much like a conventional local area network (LAN)" (see col. 1 ln. 58-65). The claimed "communication management unit, coupled to the network signal bus, the communication management unit further coupled to multiple bidirectional communication interface devices, such communication interface device effecting real-tie communication with a different one of a multiplicity of substantially incompatible signal sources" are met by network controller 186, aircraft systems 198, and off aircraft communication 188 (see Figure 9a). However, the Galipeau et al. reference is silent wherein each of the plurality of display devices cooperating over a local area network defining a distributed server local area network architecture. Now note the Kumar et al. reference that discloses a method and apparatus for executing a distributed algorithm or service on a simple network management protocol based computer network. The Kumar et al. reference discloses a distributed local area network (see col. 3, ln. 4-14) wherein each node is both a manager and an agent (client and server). Therefore, the examiner submits that it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the Galipeau et al. centralized manager configuration with the Kumar et al. distributed client/server nodes for the purpose of reducing

Art Unit: 2614

communication overhead that occurs around a management station and alleviating the centralized management's inherent single point of failure (see col. 1, ln. 41-59).

As to claim 7, note the Galipeau et al. reference discloses an aircraft multimedia communication system. The claimed "a plurality of display devices, each display device disposed in a location separate from other ones of the plurality of display devices, each display device including at least a control processor, a local memory storage area and a graphical display screen" are met by locationally separate nodes (see Fig. 1) comprising display, memory and processor (see Fig. 12 (226) and col. 11 ln. 55) as well as seat-to-seat serial cables and harnesses (see Fig. 1 (20), Fig. 9b *20) and col. 4 ln. 31-34). The claimed network signal bus interconnecting each of the plurality of display devices is met by seat-to-seat serial cables and harnesses (see Fig. 1 (20), Fig. 9b (20) and col. 4 ln. 31-34) wherein "... on-aircraft data server stores and compresses digital audio and video streams, retrieves the video and audio data, merges it into a continuous stream...delivers it seamlessly to the in-flight distribution network. Operating much like a conventional local area network (LAN)" (see col. 1 ln. 58-65). The claimed "communication management unit, coupled to the network signal bus, the communication management unit further coupled to multiple bi-directional communication interface devices, such communication interface device effecting real-tie communication with a different one of a multiplicity of substantially incompatible signal sources" are met by network controller 186, aircraft systems 198, and off aircraft communication 188 (see Figure 9a). However, the Galipeau et al. reference is silent wherein each of the plurality of display devices cooperating over a local area network defining a distributed server local area network architecture. Now note the Kumar et al. reference that discloses a method and apparatus for executing a distributed

Art Unit: 2614

algorithm or service on a simple network management protocol based computer network. The Kumar et al. reference discloses a distributed local area network (see col. 3, ln. 4-14) wherein each node is both a manager and an agent (client and server). Therefore, the examiner submits that it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the Galipeau et al. centralized manager configuration with the Kumar et al. distributed client/server nodes for the purpose of reducing communication overhead that occurs around a management station and alleviating the centralized management's inherent single point of failure (see col. 1, ln. 41-59).

As to claim 8, see rejection of claim 7.

As to claim 9, as noted above, the nodes of the distributed network act as servers in the distributed server network architecture. Galipeau et al. particularly discloses the serving of multiple applications and data from multiple sources (see Fig.12 (192),(198), and col.2 ln.59).

4. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Galipeau et al. (US 6,249,913 B1) in further view of Kumar et al. (US 5,561,769) and Hadinger (US 6,512,921 B1).

As to claim 6, the claimed "first satellite constellation, providing a first type of content" is met by "satellite constellation providing content 242 (see Fig.12 and col.12 ln. 57-63). The claimed "broadband bi-directional VHF communication medium" is met by the system illustrated in Figure 12. However, the Galipeau et al. reference is silent as to a second constellation providing a second type of content. Now note the Hadinger reference that discloses satellite multimedia delivery to vehicles. The claimed "second satellite constellation providing a second type of content" is met by multiple satellites delivering distinct content (see Fig.2 and col.1 ln. 18-30) for the purpose of receiving various types of data in a vehicle. Therefore, the

Art Unit: 2614

examiner submits that it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the Galiepeau et al. content with the Hadinger et al. multiple content sources for the purpose of obtaining an enhanced degree of variability and economy.

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

The Margis reference (US 5,568,484) discloses a telecommunications system and method for use on commercial aircraft and other vehicles.

The Humpleman reference (US 5,940,387) discloses a home multimedia network architecture.

The Barton reference (US 6,310,886 B1) discloses a method and apparatus implementing a multimedia digital network.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Johnny Ma whose telephone number is (703) 305-8099. The examiner can normally be reached on 8:00 am - 5:00 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, John Miller can be reached on (703) 305-4795. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
